Preface

1.1 Declaration

This document updates at irregular intervals because of product upgrade or other reason.

This document is for your reference only.

1.2 Suggestion feedback

If you have any questions when using our product and reading this document, please contact us:

Email:

1.3 Audience

This document is for the following audiences:

- System maintenance engineers
- Debugging and testing engineers
- Network monitoring engineers
- Field maintenance engineers

2

Brief Introduction

This document describes the basic conceptions, applications and usages (include network topology, configuration examples and limitations) of TAP series devices.

2.1 TAP Group introduction

A TAP Group has at least one ingress port and one egress port. The ingress and egress ports should be link aggregation or physical ports. TAP series devices support 2 modes: PORT and PORT WITH FLOW.

Figure 2-1 Composition of TAP group

2.1.2 Port mode

Applications are taking effect on all packets which pass through the port.

One ingress port can only belong to one TAP group. One Egress port can belong to several TAP groups.

All packets enter the ingress port should be forward to the egress port.

2.1.3 Port with flow mode

Applications are taking effect on packets which pass through the port and match the flow rule. One ingress port with different flow rules can join different TAP Groups. One Egress port can join several TAP groups.

Packets enter the ingress port should compare with the flow rule, only the packets matching the flow rule can be forward to the egress port.

E.g.: eth-0-1 with Flow A is the ingress member of TAP group 1; eth-0-1 with Flow B is the ingress member of TAP group 2. When the packets enter the port eth0-01, packets which match Flow A should forward to TAP group1's egress port; packets which match Flow B should forward to TAP group2's egress port.

2.2 FLOW types

TAP series devices support 2 types of the flow: default (UDF) Flow; decap (inner-match) Flow.

Default Flow is used for matching normal packets.

Decap Flow is used for matching the inner header of the packet which is encapsulated with GRE/NVGRE/VXLAN, etc.

2.3 Precondition

The following actions are supported for both PORT and PORT WITH FLOW mode:

- VLAN remarking
- VLAN heading stripping
- Packet editing
- Packet truncating
- Time stamp

The following actions are only supported on PORT WITH FLOW mode:

- GRE/NVGRE/VXLAN/IPIP/ERSPAN/MPLS/PPPOE/header stripping and UDF header
- L2-GRE/L3-GRE/VXLAN/ERSPAN header adding
- Inner header field matching

: Supported actions for different mode

Action/Mode	PORT	PORT with FLOW
VLAN remarking	✓	✓
VLAN heading stripping	✓	✓
Packet truncating	✓	✓
Packet editing	✓	✓
Inner header field matching	×	✓
Packet header stripping	×	✓
Inner VXLAN header stripping	×	✓
Time STAMP (Apply to the egress port of TAP Group)	✓	✓

2.4 Limitations

Table 2-1 Mutual exclusion table

	VLAN header stripping	VLAN remarking	Packet truncating	Packet editing	Packet head stripping	Time stamp	Inner VXLAN header stripping
VLAN header stripping	N/A	×	×	✓	×	✓	×
VLAN remarking	×	N/A	×	✓	✓	✓	✓
Packet truncating	×	×	N/A	×	×	×	×
Packet editing	✓	✓	×	N/A	✓	×	✓

Packet head stripping	×	✓	×	✓	N/A	✓	✓
Time stamp	✓	✓	×	×	✓	N/A	✓
Inner VXLAN header stripping	×	✓	×	✓	✓	✓	N/A

- ✓ : These 2 actions can be configured together.
- × : These 2 actions are mutually exclusive and cannot be configured together.

3

Device Management Configuration

TAP series devices have 2 types of management ports: Ethernet port and console port. Users can choose any of these management ports to manage the device.

3.1 Configuring console port for management

3.1.1 Configuration

Before you can assign switch information, make sure you have connected a PC or terminal to the console port, and configured the PC or terminal software parameters to match the default console port parameters.

The follow list describes the default value of console parameters for TAP series switches:

- Baud rate default is 115200.
- Data bits default is 8.
- Stop bits default is 1.
- Parity settings default is none.

Users can modify the console parameters after login in the switch. The following example shows how to set the baud rate as 9600:

```
TAP# configure terminal
TAP(config)# line console 0
TAP(config-line)# speed 9600
```

3.1.2 Validation

The following example shows how to display the configuration of the console port:

```
TAP# show console
Current console configuration:
-----
line console 0
  speed 9600
  parity none
  databits 8
  stopbits 1
  exec-timeout 10 0
```

```
privilege level 1
no line-password
no login
```

3.2 Configuring out band Ethernet port for management

Users should set the management IP address by console port before managing the device by out band Ethernet port.

3.2.1 Configuration

Set the management IP address as 10.10.10.11/23:

```
TAP# configure terminal
TAP(config)# management ip address 10.10.10.11/23
```

(optional) Set the management gateway address:

```
TAP# configure terminal
TAP(config)# management route gateway 10.10.10.1
```

3.2.2 Validation

The following example shows how to display the configuration:

```
TAP# show management ip address
Management IPv4 address: 10.10.10.11/23
IPv4 Gateway: 10.10.10.1
```

3.3 Configuring Temperature

TAP series switches support temperature alarm management.

Users can configure three temperature thresholds: low, high and critical. When the temperature of the device is lower than low threshold or higher than higher threshold, the device will give an alarm. If the temperature of the device is higher than the critical threshold, the device will cut off its power automatically.

NOTE The critical threshold is not recommended to set too low, otherwise it may lead the device reboot unnecessary

3.3.1 Configuration

The following example shows how to set the low threshold of the device as 10°C; high threshold of the device as 70°C; critical threshold of the device as 85°C:

```
TAP# configure terminal
TAP(config)# temperature 10 70 85
```

NOTE

Users can set the temperature of the board. The temperature of the chip cannot be changed.

3.3.2 Validation

The following example shows how to display the configuration of the temperature:

```
TAP# show environment
Fan tray status:
Index      Status      SpeedRate      Mode
-----+-----+-----+-----
1-1        OK          40%            AUTO
1-2        OK          40%            AUTO
1-3        OK          40%            AUTO
1-4        OK          40%            AUTO

Power status:
Index      Status      Power          Type          Alert
-----+-----+-----+-----+-----
1          PRESENT     OK             AC             NO
2          PRESENT     FAIL           -             ALERT

Sensor status (Degree Centigrade):
Index      Temperature  Lower_alarm    Upper_alarm    Critical      Position
-----+-----+-----+-----+-----+-----
1          41           10             70             85           BEFORE_CHIP
2          43           10             70             85           BEHIND_CHIP
3          34           10             70             85           AROUND_FAN
4          41           10             70             85           AROUND_CPU
5          65           -10            100            110          SWITCH_CHIP0
```

3.4 Configuring Fan

TAP series switches support fans automatically according to the temperature of the board and chip.

Table 3-1 Correspondence of the chip temperature and the fan speed

Chip temperature (°C)	Work mode of the FAN	Speed rate of the FAN
≥100	Full	100%
90≤ Temperature < 100	High	80%
80≤ Temperature < 90	Low	60%
≤80	Bottom	40%

Table 3-2 Correspondence of the board temperature and the fan speed

Board temperature (°C)	Work mode of the FAN	Speed rate of the FAN
------------------------	----------------------	-----------------------

≥80	Full	100%
65 ≤ Temperature < 80	High	80%
50 ≤ Temperature < 65	Low	60%
≤50	Bottom	40%

NOTE

e.g. When the chip and the board are both 65 °C, according to Table 2-1 the FAN speed should be 40%, according to Table 2-2 the FAN speed should be 80%. The real speed should be according to the higher one (80%).

3.4.2 Configuration

This application does not have any command line.

3.4.3 Validation

This application does not have any command line.

```
TAP# show environment
Fan tray status:
Index      Status      SpeedRate    Mode
-----+-----+-----+-----
1-1        OK           40%          AUTO
1-2        OK           40%          AUTO
1-3        OK           40%          AUTO
1-4        OK           40%          AUTO

Power status:
Index      Status      Power      Type      Alert
-----+-----+-----+-----+-----
1          PRESENT     OK          AC         NO
2          PRESENT     FAIL        -          ALERT

Sensor status (Degree Centigrade):
Index      Temperature  Lower_alarm  Upper_alarm  Critical  Position
-----+-----+-----+-----+-----+-----
1          41           10           70           85        BEFORE_CHIP
2          43           10           70           85        BEHIND_CHIP
3          34           10           70           85        AROUND_FAN
4          41           10           70           85        AROUND_CPU
5          65           -10          100          110       SWITCH_CHIP0
```

3.5 Configuring Power

TAP series switches support to manage power status automatically. When the power is failed or the fan is failed because of the power issue, the device should give an alarm. If power is removed or inserted, the switch should give an alarm too.

3.5.1 Configuration

This application does not have any command line.

3.5.2 Validation

The following example shows how to display the power information

```
TAP# show environment
Fan tray status:
Index      Status      SpeedRate    Mode
-----+-----+-----+-----
1-1        OK          40%          AUTO
1-2        OK          40%          AUTO
1-3        OK          40%          AUTO
1-4        OK          40%          AUTO

Power status:
Index      Status      Power      Type      Alert
-----+-----+-----+-----+-----
1          PRESENT    OK          AC         NO
2          PRESENT    FAIL        -          ALERT

Sensor status (Degree Centigrade):
Index      Temperature  Lower_alarm  Upper_alarm  Critical  Position
-----+-----+-----+-----+-----+-----
1          41           10           70           85        BEFORE_CHIP
2          43           10           70           85        BEHIND_CHIP
3          34           10           70           85        AROUND_FAN
4          41           10           70           85        AROUND_CPU
5          65           -10          100          110       SWITCH_CHIP0
```

3.6 Configuring Transceiver

TAP series switches support to check up the information of the transceiver. The transceiver information includes basic information and diagnostic information. The basic information includes transceiver type, vendor name, PN, S/N, wavelength and link length for supported type. The diagnostic information includes real-time temperature, voltage, current, optical transmit power, optical receive power and the threshold about these parameters. When the transceiver is inserted or removed or the real-time parameter is out of threshold, the switch should notice the users.

3.6.1 Configuration

This application does not have any command line.

3.6.2 Validation

The following example shows how to display the basic transceiver information:

```
TAP# show transceiver
```

```
Port eth-0-1 transceiver info:
Transceiver Type: 1000BASE-SX
Transceiver Vendor Name : FINISAR CORP.
Transceiver PN          : FTLF8519P3BNL
Transceiver S/N         : PL36KUC
Transceiver Output Wavelength: 850 nm
Supported Link Type and Length:
    Link Length for 50/125um multi-mode fiber: 300 m
    Link Length for 62.5/125um multi-mode fiber: 150 m
```

The following example shows how to display the detailed transceiver information:

```
TAP# show transceiver detail eth-0-1

Port eth-0-1 transceiver info:
Transceiver Type: 1000BASE-SX
Transceiver Vendor Name : FINISAR CORP.
Transceiver PN          : FTLF8519P3BNL
Transceiver S/N         : PL36KUC
Transceiver Output Wavelength: 850 nm
Supported Link Type and Length:
    Link Length for 50/125um multi-mode fiber: 300 m
    Link Length for 62.5/125um multi-mode fiber: 150 m

-----
Transceiver is internally calibrated.
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
++ : high alarm, + : high warning, - : low warning, -- : low alarm.
The threshold values are calibrated.
-----
```

Port	Temperature (Celsius)	High Alarm Threshold (Celsius)	High Warn Threshold (Celsius)	Low Warn Threshold (Celsius)	Low Alarm Threshold (Celsius)
eth-0-1	39.10	110.00	93.00	-30.00	-40.00

Port	Voltage (Volts)	High Alarm Threshold (Volts)	High Warn Threshold (Volts)	Low Warn Threshold (Volts)	Low Alarm Threshold (Volts)
eth-0-1	3.32	3.60	3.50	3.10	3.00

Port	Current (milliamperes)	High Alarm Threshold (mA)	High Warn Threshold (mA)	Low Warn Threshold (mA)	Low Alarm Threshold (mA)
eth-0-1	6.56	13.00	12.50	2.00	1.00

Port	Optical Transmit Power (dBm)	High Alarm Threshold (dBm)	High Warn Threshold (dBm)	Low Warn Threshold (dBm)	Low Alarm Threshold (dBm)
eth-0-1	-5.11	0.00	-3.00	-9.50	-13.50

Port	Optical Receive Power (dBm)	High Alarm Threshold (dBm)	High Warn Threshold (dBm)	Low Warn Threshold (dBm)	Low Alarm Threshold (dBm)
eth-0-1	-6.15	0.50	-1.00	-16.99	-21.02

4 Interface configuration

4.1 Configuring Interface Split

4.1.1 Configuration

The following example shows how to split a 40G port into four 10G ports:

```
TAP# configure terminal
TAP(config)# split interface eth-0-1 10giga
```

NOTE

Users must reboot the switch to take effect.

4.1.2 Validation

The following example shows how to display the splitting information:

```
TAP# show interface status
```

Name	Status	Duplex	Speed	Mode	Type	Description
eth-0-1/1	down	auto	auto	trunk	UNKNOWN	
eth-0-1/2	down	auto	auto	trunk	UNKNOWN	
eth-0-1/3	down	auto	auto	trunk	UNKNOWN	
eth-0-1/4	down	auto	auto	trunk	UNKNOWN	

4.2 Configuring Interface State

4.2.1 Configuration

The following example shows how to turn up eth-0-1 and turn down eth-0-2:

4.2.2 Validation

The following example shows how to display the interface information:

```
TAP# show interface status
```

Name	Status	Duplex	Speed	Mode	Type	Description
eth-0-1	up	a-full	a-1000	trunk	1000BASE_SX	
eth-0-2	admin down	auto	a-1000	trunk	1000BASE_SX	

4.3 Configuring Interface Duplex

4.3.1 Configuration

The following example shows how to set duplex of eth-0-1 to full and duplex of eth-0-2 to auto:

```
TAP# configure terminal
TAP(config)# interface eth-0-1
TAP(config-if-eth-0-1)# duplex full
TAP(config-if-eth-0-1)# exit
TAP(config)# interface eth-0-2
TAP(config-if-eth-0-2)# duplex auto
```

4.3.2 Validation

The following example shows how to display the duplex information:

```
TAP# show interface status
```

Name	Status	Duplex	Speed	Mode	Type	Description
eth-0-1	up	full	a-1000	trunk	1000BASE_SX	
eth-0-2	up	a-full	a-1000	trunk	1000BASE_SX	

4.4 Configuring Interface Speed

4.4.1 Configuration

The following example shows how to set speed of eth-0-1 to 1000M:

```
TAP# configure terminal
TAP(config)# interface eth-0-1
TAP(config-if-eth-0-1)# speed 1000
```

4.4.2 Validation

The following example shows how to display the speed information:

```
TAP# show interface status
```

Name	Status	Duplex	Speed	Mode	Type	Description
eth-0-1	up	full	1000	trunk	1000BASE_SX	

4.5 Configuring Unidirectional

4.5.1 Configuration

The following example shows how to set unidirectional of eth-0-1:

```
TAP# configure terminal
TAP(config)# interface eth-0-1
TAP(config-if-eth-0-1)# unidirectional enable
```

```
TAP(config-if-eth-0-1)# speed 1000
TAP(config-if-eth-0-1)# duplex full
TAP(config-if-eth-0-1)# end
```

The following example shows how to set unidirectional rx-only of eth-0-2:

```
TAP# configure terminal
TAP(config)# interface eth-0-2
TAP(config-if-eth-0-1)# unidirectional rx-only
TAP(config-if-eth-0-1)# speed 1000
TAP(config-if-eth-0-1)# duplex full
TAP(config-if-eth-0-1)# end
```

4.5.2 Validation

The following example shows how to display the unidirectional information:

```
TAP# show interface status
```

Name	Status	Duplex	Speed	Mode	Type	Description
eth-0-1	up	full	1000	trunk	1000BASE_SX	
eth-0-2	up	full	1000	trunk	1000BASE_SX	

NOTE

Interface state is always up when unidirectional is enabled. Duplex auto and speed auto are not supported when unidirectional is enabled, users should set proper duplex and speed value.

4.6 Configuring Interface Errdisable

4.6.1 Overview

1 Function Introduction

Errdisable is a mechanism to protect the system through shutdown the abnormal interface. If an interface enters errdisable state, there are two ways to recovery it from errdisabled state. The first one is to enable errdisable recovery of this reason before errdisable detection; the interface will be recovered automatically after the configured time. But if errdisable occurred first, then errdisable recovery is enabled, the errdisable will not be recovered automatically. The secondary one is configuring “no shutdown” command on the errdisabled interface.

The flap of interface link state is a potential error caused by hardware or line problem. The administrator can also configure the detection conditions of interface link flap to suppress the flap.

2 Principle Description

N/A

4.6.2 Configuration

Figure 4-1 Errdisable topology

2 Configuring Errdisable Detection

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Enable detect link flap errdisable

```
Switch(config)# errdisable detect reason link-flap
```

step 3 Exit the configure mode

```
Switch(config)# end
```

step 4 Validation

Use the following command to display the configuration of error disable :

```
Switch# show errdisable detect
ErrDisable Reason      Detection status
-----+-----
link-flap              Enabled
```

3 Configuring Errdisable Recovery

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Enable errdisable and set recovery interval

```
Switch(config)# errdisable recovery reason link-flap
Switch(config)# errdisable recovery interval 30
```

step 3 Exit the configure mode

```
Switch(config)# end
```

step 4 Validation

Use the following command to display the configuration of error disable recovery :

```
Switch# show errdisable recovery
ErrDisable Reason      Timer status
-----+-----
link-flap              Enabled
Timer interval: 30 seconds
```

4 Configuring suppress Errdisable link Flap

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Set link flap condition

```
Switch(config)# errdisable flap reason link-flap 20 60
```

step 3 Exit the configure mode

```
Switch(config)# end
```

step 4 Validation

Use the following command to display the configuration of error disable flap :

```
Switch# show errdisable flap
ErrDisable Reason      Flaps      Time (sec)
-----
link-flap              20         60
```

5 Checking Errdisable Status

Administrators can check the interface errdisable status through two commands.

Case 1 Enable errdisable recovery

If link flap errdisable is enabled recovery, the command will display the left time for recovery, Otherwise, will display “unrecovery”.

```
Switch# show errdisable recovery
ErrDisable Reason      Timer Status
-----
link-flap              Enabled
Timer interval: 300 seconds
Interfaces that will be enabled at the next timeout:
Interface Errdisable Reason Time Left(sec)
-----
eth-0-3    link-flap              25
```

Case 2 Disable errdisable recovery

```
Switch# show errdisable recovery
ErrDisable Reason      Timer Status
-----
link-flap              Disabled
Timer interval: 300 seconds
```

case 3 Display interface brief information to check errdisable state.

```
Switch# show interface status
Port      Status      Duplex      Speed      Mode      Type      Description
-----
eth-0-1    up          a-full     a-1000     TRUNK     1000BASE_SX
eth-0-2    down        auto        auto        TRUNK     Unknown
eth-0-3    errdisable a-full     a-1000     TRUNK     1000BASE_SX
eth-0-4    down        auto        auto        ACCESS    Unknown
```

4.6.3 Application cases

N/A

5

SSH configuration

The Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. SSH supports the Data Encryption Standard (DES) encryption algorithm, the Triple DES (3DES) encryption algorithm, and password-based user authentication. The SSH feature has an SSH server and an SSH integrated client, which are applications that run on the switch. You can use an SSH client to connect to a switch running the SSH server. The SSH server works with the SSH client supported in this release and with SSH clients. The SSH client also works with the SSH server supported in this release and with SSH servers.

5.1.1 Configuration

The following example shows how to create a key which is named by “a”:

```
TAP# configure terminal
TAP(config)# rsa key a generate
```

The following example shows how to generate private key “a.pri” and public key “a.pub”, then put them on the FTP server:

```
TAP(config)# rsa key a export mgmt-if url
ftp://username:password@host:port/a.pri private ssh2
TAP(config)# rsa key a export mgmt-if url
ftp://username:password@host:port/a.pub public ssh2
```

The following example shows how to download the public key from the FTP server and configure the user name of the device which need to login with SSH:

```
TAP(config)# rsa key a.pub import mgmt-if url ftp://
username:password@host:port/a.pub public ssh2
TAP(config)# username aaa privilege 4 password 123
TAP(config)# username aaa assign rsa key a.pub
```

5.1.2 Validation

The following example shows how to download the private key on the client and login with SSH:

```
[TAP@localhost]$ ssh -i a.pri aaa@10.10.33.122
```

Syslog configuration

System information can be saved in a log file or be sent to other servers on the network. By default, The TAP series devices logs normal but significant system messages to its internal buffer and sends these messages to the system console.

Users can check out the messages on the system console or the specified log server. The messages are time-stamped to enhance real-time debugging and management.

Table 5-1 System message types

Name	definition
kern	Kernel message
user	Random user level message
mail	Mail system message
daemon	System daemon message
auth	Security/certification message
syslog	Inner message generated by daemon "syslogd"
lpr	Line printer message
news	Network news message
uucp	UUCP message
cron	Clock daemon message
authpriv	Privacy security certification message
ftp	FTP message

5.2 Configuring log server

5.2.1 Configuration

The following shows how to enable the log server, how to set the IP address of the server and how to set the log level:

```
TAP# configure terminal
TAP(config)# logging server enable
TAP(config)# logging server address mgmt-if 10.10.22.204
TAP(config)# logging server severity debug
```

Table 5-1 Log level definition

Severity Level	Definition
emergency	system is unusable(0)
alert	action must be taken immediately(1)
critical	critical conditions(2)
error	error conditions(3)
warning	warning conditions(4)
notice	normal but significant condition(5)
information	Informational(6)
debug	debug-level messages(7)

5.2.2 Validation

The following example shows how to display the system log configuration information:

```
TAP# show logging
Current logging configuration:
-----
logging buffer 500
logging timestamp bsd
logging file enable
logging level file warning
logging level module debug
logging server enable
logging server severity debug
logging server facility local4
logging server address 10.10.22.204
logging merge enable
logging merge fifo-size 1024
logging merge timeout 10
```

5.3 Configuring Logging Buffer Size

5.3.1 Configuration

The following example shows how to set the logging buffer size to 700 messages:

```
TAP# configure terminal
TAP(config)# logging buffer 700
```

5.3.2 Validation

The following example shows how to display the system log configuration information:

```
TAP# show logging
Current logging configuration:
-----
logging buffer 700
logging timestamp bsd
logging file enable
logging level file warning
logging level module debug
logging server enable
logging server severity debug
logging server facility local4
logging server address 10.10.22.204
logging merge enable
logging merge fifo-size 1024
logging merge timeout 10
```

6

Time configuration

The devices need the correct system time in order to co-work with other devices. Users can set the system date and time manually if there is no timer source outside.

6.1.1 Configuration

The following example shows how to set system time:

```
TAP# configure terminal
TAP(config)# clock set datetime 10:10:12 3 7 2017
```

The following example shows how to display the system time:

```
TAP# show clock
10:10:16 Beijing Tue Mar 07 2017
Time Zone(Beijing) : UTC+08:00:00
```

7

User Management configuration

User management can improve the security level of the system. Only the authorized users can login to the system.

Table 7-1 Login modes for TAP series devices

mode	definition
Login local	Login with the username and password configured in the system.
Login	Login with the password configured in the "line vty" mode.
No login	Login without password

7.2 Configuring the user management in login local mode

7.2.1 Configuration

The following example shows how to use the "login local" mode. Set username to "test", set password to "123", and choose "login local" mode:

```
TAP# configure terminal
TAP(config)# line vty 0 7
TAP(config-line)# login local
TAP(config-line)# exit
TAP(config)# username test privilege 4 password 123
```

7.2.2 Validation

The following example shows how to login the device via Telnet:

```
Username: test
Password:
TAP#
```

7.3 Configuring the user management in login mode

7.3.1 Configuration

The following example shows how to use the “login” mode. Set password to “123”, and choose “login” mode:

```
TAP# configure terminal
TAP(config)# line vty 0 7
TAP(config-line)# login
TAP(config-line)# line-password 123
TAP(config-line)# privilege level 4
```

7.3.2 Validation

The following example shows how to login the device via Telnet:

```
Password:
TAP#
```

NOTE

The examples above show how to configure an Ethernet management port. The configuration of the console management port is similar to Ethernet port. Use “line console 0” to enter the console configuration mode.

7.4 Password recovery

7.4.1 Configuration

If the password is forgotten unfortunately, it can be recovered by following steps. Connect the device by console port.

Reset the system by plug out and plug in the power. The follow information will be printed on Console:

```
NAND read: device 0 offset 0x200000, size 0x400000
4194304 bytes read: OK
Press ctrl+b to stop autoboot: 5
```

Choose “no pass” mode in bootrom:

```
Bootrom# boot_flash_nopass
Bootrom# Do you want to revert to the default config file ? [Y|N|E]: Y
```

NOTE

After recovering the password the configuration on the device may be lost. Please remember the password to avoid the service interruption.

7.4.2 Validation

Then the system will reboot without loading startup-configuration. No password will be required. ##

Configuring the user login with ACL ## set login acl ,and the acl name is loginACL

```
TAP# configure terminal
TAP(config)# line vty 0 7
TAP(config-line)# ip access-class loginAcl in
Notice: ACL applied on vty can only match source IP,destination IP,source
port,or destination port for TCP packets, behaviour as WhiteList by default.
```

7.4.3 Validation

User can display the configuration files as below:

```
TAP# show running-config

line vty 0 7
exec-timeout 0 0
privilege level 4
no line-password
ip access-class loginACL in
```

7.5 user login limit

```
TAP# configure terminal
TAP(config)# login-security enable
TAP(config)# login-security lock-duration 7
TAP(config)# login-security max-fail-num 6 6
```

7.5.1 Validation

User can display the configuration files as below: TAP# show running-config

```
Login Security:           Enable
Max Fail Number:         6
Fail Period:             6 min
Lock Duration:           7 min
Current Invalid Users:   0/5

Login Security Records:
User name                  Local   Locked   Resume Time(s)   Fail
Count
-----+-----+-----+-----+-----+
--
```

8

Security Configuration Guide

8.1 Configuring Line VTY ACL

8.1.1 Overview

1 Function Introduction

Login through the user interface is restricted by reference to the access control list. IPv4 acls can be referenced, and login through the user interface is not restricted by default.

Currently, only matching of source IP, destination IP, source port, or destination port for TCP packets is supported, and the default is WhiteList.

2 Principle Description

N/A

8.1.2 Configuration

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Create ACL

```
Switch(config)# ip access-list a4
Switch(config-ip-acl-a4)# permit any src-ip host 10.0.0.1 dst-ip any
Switch(config-ip-acl-a4)# exit
```

step 3 Apply the ACL under Line VTY

```
Switch(config)# line vty 0 7
Switch(config-line)# ip access-class a4 in
Notice: ACL applied on vty can only matching of source IP,destination
IP,source port,or destination port for TCP packets, behaviour as WhiteList by
default.
Switch(config-line)# end
```

step 4 Validation

```
Switch# show vty
line vty maximum 8
line vty 0 7
  privilege level 4
  no line-password
  ip access-class a4 in
  no login
```

8.1.3 Application cases

When it is necessary to restrict the login through the user interface, that is, to control the source IP, destination IP, source port or destination port, the control action is to allow access or deny access, which can be achieved through this command.

9

SNMP configuration

SNMP is a communication protocol to connect a network management systems (NMS) and agents. It defines the standardized management framework, common communication language, security and access control mechanism for monitoring and managing the devices in the network environment. Via SNMP, the administrator can connect to the device to query the information, modify the configuration, monitor the state, get the failures and generate a report automatically.

NOTE

TAP series devices support SNMP V1/V2, Only part of the OID and trap are supported.

9.1 Configuring SNMP GET

9.1.1 Configuration

The following example shows how to set the SNMP community word:

```
TAP(config)# snmp-server community test read-only
```

The following example shows how to enable SNMP service:

```
TAP(config)# snmp-server enable
```

9.1.2 Validation

Figure 9-1 Display the OID interfaceLinkStatus by applications

9.2 Configuring SNMP TRAP

9.2.1 Configuration

The following example shows how to set the SNMP TRAP server IP and the SNMP community word:

```
TAP(config)# snmp-server trap target-address mgmt-if 10.10.22.215 community public
```

The following example shows how to enable SNMP TRAP service:

```
TAP(config)# snmp-server trap enable all
```

9.2.2 Validation

No	Time	Notification	Version	Mess...	Dest...	Dest...
1	20:00:30.340	mg soft 78.1.1.0	SNMPv2c	Notif...	10.10...	162

9.3 Configuring SNMPv3 Groups, Users and Accesses

You can specify an identification name (engine ID) for the local SNMP server engine on the switch.

You can configure an SNMP server group that maps SNMP users to SNMP views, you can add new users to the SNMP group, and you can add access for the SNMP group.

Beginning in privileged EXEC mode, follow these steps to configure SNMP on the switch.

9.3.1 Configuration

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Set the global configurations for SNMP

Set engineID; Set the user name, password, and authentication type; Create SNMP server; Set the authority for the group member.

```
Switch(config)# snmp-server engineID 8000123456
Switch(config)# snmp-server usm-user usr1 authentication md5 mypassword privacy
des yourpassword
Switch(config)# snmp-server group grp1 user usr1 security-model usm
Switch(config)# snmp-server access grp1 security-model usm noauth
```

step 3 Exit the configure mode

```
Switch(config)# end
```

9.3.2 Validation

```
Switch# show running-config
snmp-server engineID 8000123456
snmp-server usm-user usr1 authentication md5 mypassword privacy des yourpassword
snmp-server group grp1 user usr1 security-model usm
snmp-server access grp1 security-model usm noauth
```

9.4 SNMPv1 and SNMPv2 notifications configure

Beginning in privileged EXEC mode, follow these steps to configure SNMP on the switch.

9.4.1 Configuration

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Set the global configurations for SNMP

Enable all supported traps; Configure a remote trap manager which IP is “10.0.0.2”; Configure a remote trap manager which IPv6 address is “2001:1000::1”.

```
Switch(config)# snmp-server trap enable all
Switch(config)# snmp-server trap target-address 10.0.0.2 community public
Switch(config)# snmp-server trap target-address 2001:1000::1 community public
```

step 3 Exit the configure mode

```
Switch(config)# end
```

9.4.2 Validation

```
Switch# show running-config
snmp-server trap target-address 10.0.0.2 community public
snmp-server trap target-address 2001:1000::1 community public
snmp-server trap enable system
snmp-server trap enable coldstart
snmp-server trap enable warmstart
snmp-server trap enable linkdown
snmp-server trap enable linkup
```

9.5 Configuring SNMPv3 notifications

9.5.1 Configuration

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Set the global configurations for SNMP

Enable all supported traps; Configure a trap notify item for SNMPv3; Configure a remote trap manager's IP address; Configure a remote trap manager's IPv6 address; Add a local user to SNMPv3 notifications.

```
Switch(config)# snmp-server trap enable all
Switch(config)# snmp-server notify notif1 tag tmptag trap
Switch(config)# snmp-server target-address targ1 param parm1 10.0.0.2 taglist
tmptag
Switch(config)# snmp-server target-address t1 param p1 2001:1000::1 taglist tag1
Switch(config)# snmp-server target-params parm1 user usr1 security-model v3
message-processing v3 noauth
```

step 3 Exit the configure mode

```
Switch(config)# end
```

9.5.2 Validation

```
Switch# show running-config
snmp-server notify notif1 tag tmptag trap
snmp-server target-address t1 param p1 2001:1000::1 taglist tag1
snmp-server target-address targ1 param parm1 10.0.0.2 taglist tmptag
snmp-server target-params parm1 user usr1 security-model v3 message-processing
v3 noauth
snmp-server trap enable system
snmp-server trap enable coldstart
snmp-server trap enable warmstart
snmp-server trap enable linkdown
snmp-server trap enable linkup
```

9.6 Configuring SNMP ACL

9.6.1 Configuration

step 1 Enter the configure mode

```
Switch# configure terminal
```

step 2 Configuring ACL

Either the acl is configured to continue to configure the ace before it is applied to SNMP, or the acl is configured to be applied to SNMP before it is configured to ace.

```
Switch(config)# ip access-list a4
Switch(config-ip-acl-a4)# permit src-ip host 10.10.25.25
Switch(config-ip-acl-a4)# exit
Switch(config)#
```

step 3 Apply ACL to SNMP

```
Switch(config)# snmp-server access-group a4 in
```

step 4 Exit the configure mode

```
Switch(config)# end
```

9.6.2 Validation

```
Switch# show running-config
Building configuration...
version 2.1.9.8.1
!
!
snmp-server enable

10

File Copy Configuration

10.1 Copy the file form the flash of device

The following example shows how to copy the file named “diagnostic-information.txt”.

10.1.1 Copy to TFTP server

```
TAP# copy flash:/diagnostic-information.txt mgmt-if tftp://10.10.38.160
TFTP server [10.10.38.160]
Name of the TFTP file to access []diagnostic-information.txt
```

10.1.2 Copy to FTP server

```
TAP# copy flash:/diagnostic-information.txt mgmt-if ftp://10.10.25.33
FTP server [10.10.25.33]
User name [] test
Password []
Name of the FTP file to access []diagnostic-information.txt
```

10.1.3 Copy to USB disk

```
TAP# copy flash:/diagnostic-information.txt udisk:
```

10.2 Copy the file to the flash of device

10.2.1 Copy from TFTP server

```
TAP# copy mgmt-if tftp://10.10.38.160/diagnostic-information.txt flash:
```

10.2.2 Copy from FTP server

```
TAP# copy mgmt-if ftp://10.10.25.33/diagnostic-information.txt flash:/
FTP server [] 10.10.25.33
User name [] test
Password []
Name of the FTP file to access []diagnostic-information.txt
```

10.2.3 Copy from USB disk

```
TAP# copy udisk:/diagnostic-information.txt flash:
```

11

M:N configuration

11.1 Networking requirements

Figure 11-1 Topology of M:N networking:

11.2 Configuration Ideas

In some cases, packets entering the device from different ports need to be sent to different monitors. Therefore TAP M:N mode is required. The packets enter the ingress ports will send copies to all egress ports. Reference to Figure 10-1: Packets enter eth-0-1 will send copies to eth-0-9/eth-0-10/eth-0-11. Packets enter eth-0-2 will also send copies to eth-0-9/eth-0-10/eth-0-11.

11.3 Configuration

The following example shows to create a TAP group with ingress port eth-0-1/eth-0-2, with egress port eth-0-9/eth-0-10/eth-0-11:

```
TAP# configure terminal
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1
```

```
TAP(config-tap-tap1)# ingress eth-0-2
TAP(config-tap-tap1)# egress eth-0-9
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# egress eth-0-11
```

11.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
  ID: 1
  Ingress:
    eth-0-1
    eth-0-2
  egress:
    eth-0-9
    eth-0-10
    eth-0-11
```

11.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config

tap-group tap1 1
  ingress eth-0-1
  ingress eth-0-2
  egress eth-0-9
  egress eth-0-10
  egress eth-0-11
```

12 Load Balance Configuration(HASH)

12.1 Networking requirements

Figure 12-1 Topology of load balance:

12.2 Configuration Ideas

In some cases, the capability of the port is 40G/s, but the capability of the server or analyzer is 10G/s. Therefore, load balance is required to resolve this problem. Reference to Figure 11-1, eth-0-1 is a 40G port, Agg1 is a link aggregation port with four 10G members (eth-0-9/eth-0-10/eth-0-11/eth-0-12). Packets entering eth-0-1 should choose an outgoing port among eth-0-9/eth-0-10/eth-0-11/eth-0-12, according to the load balance rule.

12.3 Configuration

The following example shows how to add eth-0-9/eth-0-10/eth-0-11/eth-0-12 into the link aggregation port Agg1:

```
TAP# configure terminal
TAP(config)# interface eth-0-9
TAP(config-if-eth-0-9)# static-channel-group 1
TAP(config-if-eth-0-9)# interface eth-0-10
TAP(config-if-eth-0-10)# static-channel-group 1
TAP(config-if-eth-0-10)# interface eth-0-11
TAP(config-if-eth-0-11)# static-channel-group 1
TAP(config-if-eth-0-11)# interface eth-0-12
TAP(config-if-eth-0-12)# static-channel-group 1
```

The flowing example shows how to create a TAP group with ingress port eth-0-1, egress port Agg1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1
TAP(config-tap-tap1)# egress agg1
```

The flowing example shows how to set the load balance rule to hash by source MAC address (The default rule is hash by source IP, destination IP, source port, destination port):

```
TAP(config)# port-channel load-balance set src-mac
TAP(config)# end
```

(Optional) support detailed hash rule, e.g. inner IP/ inner MAC, .etc.

```
TAP(config)# port-channel load-balance set inner-dst-ip
TAP(config)# end
```

The follow command is necessary if user enable to load balance by inner fields:

```
TAP(config)# port-channel load-balance tunnel-hash-mode both
```

12.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1
  egress:
    agg1
```

The following example shows how to display the load balance rule:

```
TAP# show port-channel load-balance
Port-channel load-balance hash fields:
-----
src-mac
src-ip
dst-ip
src-port-l4
dst-port-l4
```

12.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
port-channel load-balance set src-mac
!
interface eth-0-9
  static-channel-group 1
!
interface eth-0-10
  static-channel-group 1
!
interface eth-0-11
```

```
static-channel-group 1
!
interface eth-0-12
static-channel-group 1
!
tap-group tap1 1
  ingress eth-0-1
  egress aggl
```

Table 12-1 load balance fields

Load balance field	Description
src-mac	Load balance by source MAC address
dst-mac	Load balance by destination MAC address
src-ip	Load balance by source IP address
dst-ip	Load balance by destination IP address
ip-protocol	Load balance by ip-protocol
src-port-l4	Load balance by source port
dst-port-l4	Load balance by destination port
vlan-vni	Vni of vxlan
inner-dst-mac	Inner Source MAC address based load balancing
inner-src-mac	Inner Destination MAC address based load balancing
inner-src-ip	Inner Source IP address based load balancing
inner-dst-ip	Inner Destination IP address based load balancing
gre-key	Key of GRE
nvgre-vsids	Vsids of nvgre
nvgre-flow-id	Flow ID of GRE

13 Load Balance Configuration(RR)

13.1 Networking requirements

Figure 13-1 Topology of load balance

13.2 Configuration Ideas

In some cases, the capability of the port is 40G/s, but the capability of the server or analyzer is 10G/s. Therefore, load balance is required to resolve this problem. Reference to Figure 11-1, eth-0-1 is a 40G port, Agg1 is a link aggregation port with four 10G members (eth-0-9/eth-0-10/eth-0-11/eth-0-12). Packets entering eth-0-1 should choose an outgoing port among eth-0-9/eth-0-10/eth-0-11/eth-0-12, according to the round-robin rule.

13.3 Configuration

The flowing example shows how to set the load balance mode to round-robin:

```
TAP# configure terminal
TAP(config)# port-channel 1 load-balance-mode round-robin
```

NOTE

TAP series device supports at most 16 link aggregation ports to use round-robin mode. Round-robin mode must configure before link aggregation port is created.

The following example shows how to add eth-0-9/eth-0-10/eth-0-11/eth-0-12 into the link aggregation port Agg1:

```
TAP# configure terminal
TAP(config)# interface eth-0-9
TAP(config-if-eth-0-9)# static-channel-group 1
TAP(config)# interface eth-0-10
TAP(config-if0)# static-channel-group 1
TAP(config)# interface eth-0-11
TAP(config-if1)# static-channel-group 1
TAP(config)# interface eth-0-12
TAP(config-if2)# static-channel-group 1
```

The flowing example shows how to create a TAP group with ingress port eth-0-1, egress port Agg1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1
TAP(config-tap-tap1)# egress agg1
```

13.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group
!
TAP-group tap1
ID: 1
  Ingress:
    eth-0-1
  egress:
    agg1
```

13.5 Configuration file

The following example shows how to display the information of the TAP group:

```
TAP# show running-config
!
port-channel 1 load-balance-mode round-robin
!
interface eth-0-9
  static-channel-group 1
!
interface eth-0-10
  static-channel-group 1
!
interface eth-0-11
  static-channel-group 1
!
interface eth-0-12
  static-channel-group 1
!
tap-group tap1 1
  ingress eth-0-1
  egress agg1
```

14

Ingress PORT with FLOW configuration

14.1 Configuring basic Flow

14.1.1 Networking requirements

Figure 14-1 Topology of PORT with FLOW

14.1.2 Configuration Ideas

In some cases, packets from one interface need to copy to different outgoing ports. Using the PORT with FLOW TAP groups can redirect the packets to different ports. Reference to Figure 13-1 packets with source IP address 1.1.1.0/24 or 2.2.2.0/24 should copy to eth-0-10. Packets with source IP address 10.1.1.0/24 or 20.1.1.0/24 should copy to eth-0-11 Packets with other source IP addresses should be discarded.

14.1.3 Configuration

The follow example shows how to create a Flow rule:

```
TAP# configure terminal
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip 1.1.1.0 0.0.0.255 dst-ip any
TAP(config-flow-flow1)# permit any src-ip 2.2.2.0 0.0.0.255 dst-ip any
TAP(config-flow-flow1)# exit
TAP(config)# flow flow2
TAP(config-flow-flow2)# permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
TAP(config-flow-flow2)# permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
```

NOTE

The packets not matched by the flow rule should be discarded by default.

The following example shows how to create a TAP group with flow1 and flow2:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# exit
TAP(config)# tap-group tap2
TAP(config-tap-tap2)# ingress eth-0-1 flow flow2
TAP(config-tap-tap2)# egress eth-0-11
```

14.1.4 Validation

The following example shows how to display the flow rule information:

```
TAP# show flow1
flow flow1
sequence-num 10 permit any src-ip 1.1.1.0 0.0.0.255 dst-ip any
sequence-num 20 permit any src-ip 2.2.2.0 0.0.0.255 dst-ip any
flow flow2
sequence-num 10 permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
sequence-num 20 permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
```

The following example shows how to display the TAP group information:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
TAP-group tap2
ID: 2
  Ingress:
    eth-0-1          flow flow2
  egress:
    eth-0-11
```

14.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
 sequence-num 10 permit any src-ip 1.1.1.0 0.0.0.255 dst-ip any
 sequence-num 20 permit any src-ip 2.2.2.0 0.0.0.255 dst-ip any
!
flow flow2
 sequence-num 10 permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
 sequence-num 20 permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
!
tap-group tap1 1
 ingress eth-0-1 flow flow1
 egress eth-0-10
!
tap-group tap2 2
 ingress eth-0-1 flow flow2
 egress eth-0-11
```

Table 14-1 Flow rule fields

Field	Description
IP protocol[number any icmp igmp gre nvgre tcp udp]	Specify the IP protocol number of the flow rule. Well known IP protocols can also be specified by name. e.g. IP protocol 1 = icmp, 2 = igmp, 6 = tcp, 17 = udp, 47 = gre/nvgre (gre protocol 0x0800 = gre, 0x6558 = nvgre). Parameter “any” indicates packets with any IP protocol can match this rule.
src-ip/src-ipv6	Source IPv4/IPv6 address
dst-ip/dst-ipv6	Destination IPv4/IPv6 address
flow-label	Flow label of IPv6
Inner-match	Specify the inner match profile of the flow rule. The inner-match profile is created by the “inner-match” command in global configuration mode.
ip-precedence	IP precedence
src-port	Source layer 4 port
dst-port	Destination layer 4 port
first-fragment	Match packets with first fragment
non-first-fragment	Match packets with non first fragment

non-fragment	Match packets with non fragment
non-or-first-fragment	Match packets with non first fragment
small-fragment	Match packets with small fragment
any-fragment	Match packets with any fragment
options	Match packets with IP options
dscp	DSCP in IPv4 packets value
vxlan-vni	VNI of VXLAN
vlan	Vlan ID
inner-vlan	Inner vlan ID
cos	CoS value in vlan header
inner-cos	CoS value in inner vlan header
ether-type	Ether type
src-mac	Source mac address
dst-mac	Destination mac address
ipv4-head	IPv4 packet header
l4-head	Layer 4 header

Table 14-2 Flow rule actions

Action	Description
un-tag/un-tag-outer-vlan/un-tag-inner-vlan	Remove vlan tags of the packets.
mark-source	Specify additional outer vlan id of the outgoing packets.
edit-macda	Edit the destination mac address of the outgoing packet.
edit-macsa	Edit the source mac address of the outgoing packet.
edit-ipda/edit-ipv6da	Edit the destination IPv4/IPv6 address of the outgoing packet.

edit-ipsa/edit-ipv6sa	Edit the source IPv4/IPv6 address of the outgoing packet.
edit-vlan	Edit the vlan tag of the outgoing packet
strip-header	Strip the gre/nvgre/vxlan/ipip/erspan/mpls/ppp oe header
truncation	Truncate the packet

14.2 Configuring UDF Flow

14.2.1 Networking requirements

Figure 14-1 Topology of UDF FLOW

Figure 14-2 Packet structure for match the UDF flow rule

14.2.2 Configuration Ideas

In some cases, users need more detailed rules to filter the packets. The TAP UDF (User defined format) can accurately match the specified field UDF using the specified value and the reversed wildcard bits to match the field which is concerned. An offset is needed to point out the position in the packet to match the UDF field.

14.2.3 Configuration

The following example shows how to create an IPv4 UDF rule, match field “00 ab cd ef”, the offset is 30 bytes starting at the layer 3 header.

```
TAP# configure terminal
TAP(config)# flow udf1
TAP(config-flow-udf1)# permit any src-ip any dst-ip any ipv4-head 0xabcdef 0x0
30
```

NOTE

These examples are based on IPv4 rules. The following example shows how to create basic flow rule:

```
TAP(config)# flow flow2
TAP(config-flow-map2)# permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
TAP(config-flow-map2)# permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
```

The following example shows how to create a TAP group with udf1 and flow2:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow udf1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# exit
TAP(config)# tap-group tap2
TAP(config-tap-tap2)# ingress eth-0-1 flow flow2
TAP(config-tap-tap2)# egress eth-0-11
```

NOTE

The TAP series device supports one profile for IPv4 UDF rule, or three profiles for layer 4 UDF rule. The IPv4 UDF rule and layer 4 UDF rule are mutually exclusive. Layer 4 UDF rule has 2 key words: protocol & offset. If any of the key words is different, they belong to different profiles. IPv4 UDF rule has 1 key word: offset. (One profile for IPv4 UDF rule means all IPv4 UDF rule should use same offset)

14.2.4 Validation

The following example shows how to display the IPv4 UDF rules:

```
TAP# show flow
flow udf1
sequence-num 10 permit any src-ip any dst-ip any ipv4-head 0x00abcdef
0x00000000 30
flow flow2
sequence-num 10 permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
sequence-num 20 permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
```

The following example shows how to display the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
Ingress:
eth-0-1          flow udf1
egress:
eth-0-10

TAP-group tap2
ID: 2
Ingress:
eth-0-1          flow flow2
egress:
eth-0-11
```

14.2.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow udf1
sequence-num 10 permit any src-ip any dst-ip any ipv4-head 0x00abcdef
0x00000000 30
!
flow flow2
sequence-num 10 permit any src-ip 10.1.1.0 0.0.0.255 dst-ip any
sequence-num 20 permit any src-ip 20.1.1.0 0.0.0.255 dst-ip any
!
tap-group tap1 1
ingress eth-0-1 flow udf1
egress eth-0-10
!
tap-group tap2 2
```

```
ingress eth-0-1 flow flow2
egress eth-0-11
```

14.3 Configuring Inner-match

14.3.1 Networking requirements

Figure 14-1 Topology of Inner match

GRE/ NVGRE/ VXLAN header	Original Inner Packet
--------------------------	-----------------------

Figure 14-2 Packet for inner-match

14.3.2 Configuration Ideas

In some cases, the user needs to match the inner field of GRE/NVGRE/VXLAN packets. To meet the requirement, use the inner-match configuration.

14.3.3 Configuration

The following example shows how to create a inner-match profile, matching the destination IP address 1.1.1.1 or 1.1.1.2:

```
TAP(config)# inner-match imf
TAP(config-inner-match-imf)# match any src-ip any dst-ip 1.1.1.1 0.0.0.0
TAP(config-inner-match-imf)# match any src-ip any dst-ip 1.1.1.2 0.0.0.0
TAP(config-inner-match-imf)# exit
```

The following example shows how to create a Flow with decap enabled, matching the GRE packets with destination IP address 11.1.1.1, NVGRE packets with the destination IP address 12.1.1.1, VXLAN packets with the destination IP address 13.1.1.1, and apply the inner-match imf to this flow:

```
TAP(config)# flow inner type decap
TAP(config-flow-inner)# permit gre src-ip any dst-ip 11.1.1.1 0.0.0.0
inner-match imf
TAP(config-flow-inner)# permit nvgre src-ip any dst-ip 12.1.1.1 0.0.0.0
inner-match imf
TAP(config-flow-inner)# permit udp dst-port eq 4789 src-ip any dst-ip 13.1.1.1
0.0.0.0 inner-match imf
```

NOTE

To match the VXLAN packets, set the type to UDP and set the destination port to 4789.

Create a TAP Group and apply the flow inner match to the ingress interface:

14.3.4 Validation

The following example shows how to display the inner-match rule and the flow rule:

```
TAP# show inner-match
inner-match imf
sequence-num 1 match any src-ip any dst-ip host 1.1.1.1
sequence-num 2 match any src-ip any dst-ip host 1.1.1.2

TAP# show flow
flow inner type decap
sequence-num 10 permit gre src-ip any dst-ip host 11.1.1.1 inner-match imf
sequence-num 20 permit nvgre src-ip any dst-ip host 12.1.1.1 inner-match imf
sequence-num 30 permit udp dst-port eq 4789 src-ip any dst-ip host 13.1.1.1
inner-match imf
```

NOTE

Flows with decap enabled and disabled cannot bind to the same interface. E.g. eth-0-1 with decap flow inner is the ingress of TAP Group tap1, so eth-0-1 cannot bind with other flows without decap in any other TAP groups.

The following example shows the error notification when configure different types of flow:

```
DUT1(config)# flow flow1 type decap
DUT1(config-flow-flow1)# exit
DUT1(config)# flow flow2
DUT1(config-flow-flow2)# exit
DUT1(config)# tap-group tap1
DUT1(config-tap-tap1)# ingress eth-0-1 flow flow1
DUT1(config-tap-tap1)# exit
```

```
DUT1(config)# tap-group tap2
DUT1(config-tap-tap2)# ingress eth-0-1 flow flow2
% Interface mode conflict
```

Reference to the Topology of Inner match, packets remark with blue rectangle is not matched by any flow rule so they should be discarded.

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow inner
  egress:
    eth-0-10
```

14.3.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
inner-match imf
  sequence-num 1 match any src-ip any dst-ip host 1.1.1.1
  sequence-num 2 match any src-ip any dst-ip host 1.1.1.2
!
flow inner type decap
  sequence-num 10 permit gre src-ip any dst-ip host 11.1.1.1 inner-match imf
  sequence-num 20 permit nvgre src-ip any dst-ip host 12.1.1.1 inner-match imf
  sequence-num 30 permit udp dst-port eq 4789 src-ip any dst-ip host 13.1.1.1
inner-match imf
!
tap-group tap1 1
  ingress eth-0-1 flow inner
  egress eth-0-10
```

14.4 Configuring L2 UDF Flow

14.4.1 Networking requirements

Figure 14-1 Topology of UDF FLOW

Figure 14-2 Packet structure for match the UDF flow rule

Table 14-1 L2-L4 header for common packets

type	I2-head offset	I3-head offset	I4-head offset
TCP	Ethernet header	IP header	TCP header

UDP	Ethernet header	IP header	UDP header
ICMP	Ethernet header	IP header	ICMP header
GRE	Ethernet header	Outer IP header	GRE header
VXLAN	Ethernet header	Outer IP header	Outer UDP header
MPLS	Ethernet header	Outer MPLS label	IP header
VPLS	Ethernet header	Outer MPLS label	Inner Ethernet header

14.4.2 Configuration Ideas

In some cases, users need more detailed rules to filter the packets. The TAP UDF (User defined format) can accurately match the specified field UDF using the specified value and the reversed wildcard bits to match the field which is concerned. An offset is needed to point out the position in the packet to match the UDF field.

14.4.3 Configuration

The UDF function is enhanced on TAP product and configured by new CLI. UDF support gets maximum 4 bytes from 4 separated offset position from packets' L2 header.

```
TAP# configure terminal
TAP(config)# udf 0 offset-type l2-header
TAP(config-udf-5)# match ether-type 0x8926
TAP(config-udf-5)# offset offset0 30 offset1 31
```

The following example shows how to create UDF flow rule:

```
TAP(config)# flow udf
TAP(config-flow-udf)# sequence-num 10 permit any src-ip any dst-ip any
ether-type 0x8926 0x0 udf udf-id 0 udf0 0x50 0x00 udf1 0x60 0x00
```

The following example shows how to create a TAP group with UDF applied on ingress port:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow udf
TAP(config-tap-tap1)# egress eth-0-2
```

NOTE

The maximum number of UDF entries on the system is 4.

14.4.4 Validation

The following example shows how to display the UDF flow configuration:

```
TAP# show flow
flow udf
```

```
sequence-num 10 permit any src-ip any dst-ip any ether-type 0x8926 0x0 udf
udf-id 0 udf0 0x50 0x00 udf1 0x60 0x00
```

The following example shows how to display the TAP group:

```
TAP# show tap-group
truncation      : 144
timestamp-over-ether : 0000.0000.0000 0000.0000.0000 0x0000

TAP-group tap1
ID: 1
Ingress:
    eth-0-1      flow udf
Egress:
    eth-0-2
```

The following example shows how to display the UDF entry configuration:

```
TAP# show udf
Udf Global Information:
    Offset Unit : 1 Bytes

Udf Index 0
    Udf Type : l2 header
    Udf Match-Field:
        ether-type 0x8926 0x0
    Offset : 30|31|n/a|n/a
```

14.4.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
udf 0 offset-type l2-header
    match ether-type 0x8926
    offset offset0 30 offset1 31
!
flow udf
    sequence-num 10 permit any src-ip any dst-ip any ether-type 0x8926 0x0 udf
udf-id 0 udf0 0x50 0x00 udf1 0x60 0x00
exit
!
tap-group tap1 1
    ingress eth-0-1 flow udf
    egress eth-0-2
```

15

Egress Port Filter configuration

15.1 Networking requirements

Figure 15-1 Topology of port filter usage

15.2 Configuration Ideas

In some cases, after packets forward to the destination port, a filter is required to discard some unneeded packets. Reference to The Figure, packets with source IP address 1.0.0.0/24 from eth-0-1 should forward to eth-0-2 and Agg1(with two members eth-0-3/eth-0-4). Eth-0-3 needs to monitor the web packets, Agg1 needs to monitor all packets.

15.3 Configuration

The following example shows how to add eth-0-3/eth-0-4 into the link aggregation port Agg1:

```
TAP# configure terminal
TAP(config)# interface eth-0-3
TAP(config-if-eth-0-3)# static-channel-group 1
TAP(config-if-eth-0-3)# interface eth-0-4
TAP(config-if-eth-0-4)# static-channel-group 1
```

The following example shows how to create the filter:

```
TAP# configure terminal
TAP(config)# ip access-list filter1
TAP(config-acl-filter1)# permit tcp dst-port eq 80 src-ip any dst-ip any
TAP(config-acl-filter1)# exit
TAP(config)# ip access-list filter2
TAP(config-acl-filter2)# deny tcp dst-port eq 80 src-ip any dst-ip any
```

```
TAP(config-acl-filter2)# permit any src-ip any dst-ip any
TAP(config-acl-filter2)# end
```

NOTE

After applying the filter to the egress port, Packets which are not matched by any filter rule should be discarded by default.

The following example shows how to apply the filter:

```
TAP# configure terminal
TAP(config)# interface eth-0-2
TAP(config-if-eth-0-2)# egress filter1
TAP(config-if-eth-0-2)# exit
TAP(config)# interface agg1
TAP(config-if-agg1)# egress filter2
```

The following example shows to create a TAP group with ingress port eth-0-1, with egress port eth-0-2/Agg1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1
TAP(config-tap-tap1)# egress agg1
TAP(config-tap-tap1)# egress eth-0-2
```

15.4 Validation

The following example shows how to display the filter rules:

```
TAP# show ip access-list
ip access-list filter1
sequence-num 10 permit tcp dst-port eq 80 src-ip any dst-ip any
ip access-list filter2
sequence-num 10 deny tcp dst-port eq 80 src-ip any dst-ip any
sequence-num 20 permit any src-ip any dst-ip any
```

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1
  egress:
    eth-0-2
    agg1
```

15.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
ip access-list filter1
sequence-num 10 permit tcp dst-port eq 80 src-ip any dst-ip any
!
ip access-list filter2
```

```
sequence-num 10 deny tcp dst-port eq 80 src-ip any dst-ip any
sequence-num 20 permit any src-ip any dst-ip any
!
interface eth-0-2
 egress filter1
!
interface eth-0-3
 static-channel-group 1
!
interface eth-0-4
 static-channel-group 1
!
interface aggl
 egress filter2
!
tap-group tap1 1
 ingress eth-0-1
 egress eth-0-2
 egress aggl
```

Table 15-1 TAP Filter fields

Field	Description
IP protocol[number any icmp igmp gre nvgre tcp udp]	Specify the IP protocol number of the flow rule. Well known IP protocols can also be specified by name. e.g. IP protocol 1 = icmp, 2 = igmp, 6 = tcp, 17 = udp, 47 = gre/nvgre (gre protocol 0x0800 = gre, 0x6558 = nvgre). Parameter “any” indicates packets with any IP protocol can match this rule.
src-ip/src-ipv6	Source IPv4/IPv6 address
dst-ip/dst-ipv6	Destination IPv4/IPv6 address
flow-label	Flow label of IPv6
ip-precedence	IP precedence
first-fragment	Match packets with first fragment
non-first-fragment	Match packets with non first fragment
non-fragment	Match packets with non fragment
non-or-first-fragment	Match packets with non first fragment
small-fragment	Match packets with small fragment
any-fragment	Match packets with any fragment

options	Match packets with IP options
dscp	DSCP in IPv4 packets value
vlan	Vlan ID
inner-vlan	Inner vlan ID
cos	CoS value in vlan header
inner-cos	CoS value in inner vlan header
ether-type	Ether type
src-mac	Source mac address
dst-mac	Destination mac address
ipv4-head	IPv4 packet header
l4-head	Layer 4 header

16 VLAN Remarking Configuration

16.1 Networking requirements

Figure 16-1 Topology of VLAN Remarking

16.2 Configuration Ideas

In some cases, the server and analyzer need to separate different packets. The VLAN Remarking application can meet the requirement. Reference to the Figure Packets from eth-0-1 should add VLAN tag 10. Packets from eth-0-2 should add VLAN tag 20.

16.3 Configuration

PORT mode and PORT WITH FLOW mode both support VLAN remarking.

16.3.1 VLAN Remarking for PORT mode

The following example shows how to create TAP group, and remark the VLAN tag to 10 for the packets form eth-0-1, remark the VLAN tag to 20 for the packets form eth-0-2:

```
TAP# configure terminal
TAP(config)# tap-group tap1
```

```
TAP(config-tap-tap1)# ingress eth-0-1 mark-source 10
TAP(config-tap-tap1)# ingress eth-0-2 mark-source 20
TAP(config-tap-tap1)# egress eth-0-10
```

16.3.2 VLAN Remarking for PORT WITH FLOW mode

The following example shows how to create TAP group, and remark the VLAN tag to 10 for the packets with destination IP 1.1.1.1 from eth-0-1, remark the VLAN tag to 20 for the packets with destination IP 1.1.1.2 from eth-0-2:

```
TAP(config)# flow flow1
TAP(config-flow-map1)# permit any src-ip any dst-ip 1.1.1.1 0.0.0.0 mark-source 10
TAP(config)# flow flow2
TAP(config-flow-map1)# permit any src-ip any dst-ip 1.1.1.2 0.0.0.0 mark-source 20
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# ingress eth-0-2 flow flow2
TAP(config-tap-tap1)# egress eth-0-10
```

16.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
  ID: 1
  Ingress:
    eth-0-1          mark-src 10
    eth-0-2          mark-src 20
  egress:
    eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

16.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
tap-group tap1 1
  ingress eth-0-1 mark-source 10
  ingress eth-0-2 mark-source 20
  egress eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

17 VLAN Stripping Configuration

17.1 Networking requirements

Figure 17-1 Topology of VLAN stripping

17.2 Configuration Ideas

In some cases server or analyzer cannot deal with the packets with VLAN tag or double VLAN tags. The VLAN stripping application can resolve the problem.

Reference to the Figure, Packets from eth-0-1 with VLAN 10 should be stripped the VLAN tag, Packets from eth-0-1 with S-VLAN 20 C-VLAN 10 should be stripped the outer VLAN tag S-VLAN 20.

VLAN stripping application should do nothing to untagged packets.

17.3 Configuration

PORT mode and PORT WITH FLOW mode both support VLAN stripping.

17.3.1 VLAN Stripping for PORT mode

The following example shows how to create TAP group, strip the VLAN for the packets form eth-0-1, and send a copy to eth-0-10:

```
TAP# configure terminal
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 un-tag-outer-vlan
TAP(config-tap-tap1)# egress eth-0-10
```

17.3.2 VLAN Stripping for PORT WITH FLOW mode

The following example shows how to create TAP group, strip the VLAN for the packets with destination IP address 1.1.1.1form eth-0-1, and send a copy to eth-0-2:

```
TAP(config)# flow flow1
TAP(config-flow-map1)# permit any src-ip any dst-ip 1.1.1.1 0.0.0.0
un-tag-outer-vlan
TAP(config-flow-map1)# permit any src-ip any dst-ip any
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-2
```

17.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
  ID: 1
  Ingress:
    eth-0-1          un-tag-outer-vlan
  egress:
    eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

17.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
tap-group tap1 1
  ingress eth-0-1 un-tag-outer-vlan
  egress eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

18

Packet Editing Configuration

18.1 Networking requirements

Figure 18-1 Topology of packet editing

18.2 Configuration Ideas

In some cases, the server or analyzer can only receive the packets with the destination address equal to its own address. The packet editing application can meet the requirement. Source and destination MAC address, Source and destination IP address of the packets can be modified when entering the ingress port. Reference to the Figure, the device should modify the source and destination MAC address, Source and destination IP address of the packets from eth-0-1 and send a copy to eth-0-10.

18.3 Configuration

PORT mode and PORT WITH FLOW mode both support packet editing.

18.3.1 Packet editing for PORT mode

The following example shows how to create TAP group, edit the source and destination IP/MAC address of the packets from eth-0-1, and send a copy to eth-0-10:

```
TAP# configure terminal
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 edit-macsa a.a.a edit-macda b.b.b
edit-ipda 1.1.1.1 edit-ipsa 2.2.2.2
TAP(config-tap-tap1)# egress eth-0-10
```

18.3.2 Packet editing for PORT WITH FLOW mode

The following example shows how to create TAP group with flow rule, and edit the destination IP address to 100.100.100.1 for the packets with destination IP address 1.1.1.1, edit the destination IP address to 100.100.100.2 for the packets with destination IP address 1.1.1.2:

```
TAP(config)# flow flow1
TAP(config-flow-map1)# permit any src-ip any dst-ip 1.1.1.1 0.0.0.0 edit-ipda
100.100.100.1
TAP(config-flow-map1)# permit any src-ip any dst-ip 1.1.1.2 0.0.0.0 edit-ipda
100.100.100.2
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
```

18.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
  ID: 1
  Ingress:
    eth-0-1          edit-macda 000B.000B.000B
                    edit-macsa 000A.000A.000A
                    edit-ipda 1.1.1.1
                    edit-ipsa 2.2.2.2
  egress:
    eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

18.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
tap-group tap1 1
  ingress eth-0-1 edit-macda 000B.000B.000B edit-macsa 000A.000A.000A edit-ipda
```

```
1.1.1.1 edit-ipsa 2.2.2.2  
egress eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

19

Time Stamp Configuration

19.1 Overview

To monitor the outgoing traffic of the data center is a common application scenario of TAP. With the increase of data center scale and the improvement of the performance requirements, users need to monitor the inner traffic of the data center and get more detailed information. TAP series device provides flexible packet remarking applications, which can insert an additional header before the original packet header. The additional header uses an ether-type defined by private protocol, which can carry 16 bytes private data.

flowid 16bit	Srcport 16bit	ResidenceTime
Timestamp 64bit		

Figure 19-1 Packet structure

- Flowid: ID of the flow. Default value is 0x1000, cannot be modified.
- Srcport: source port ID of the packet. (The port ID is assigned by chip which is not same as the ID on the device panel)
- Time stamp: add the timestamp before the chip processing the packet. The duration of packets staying in the chip should not record by the timestamp.

Note: The timestamp function needs to be used in conjunction with the timestamp sync systime command.

Timestamp uses the standard Time of Day format. The high 32 bits record seconds (since 1970-01-01), the low 32 bits record nanoseconds.

The analyzer can recognize the time stamp packets by ether header, and analyze the TCP traffic by the information carried in the packets.

19.2 Networking requirements

Figure 19-1 Topology of Time stamp

19.3 Configuration Ideas

Reference to the Figure, the cluster of the server can get the accurate duration the packet spent on each node of the data center by the source port and timestamp information. Use the source port to identify different devices, use the information in timestamp to get the latency.

19.4 Configuration

The following example shows how to set private ether-type to 0xFF12, and set the destination MAC address to 1.1.1, set the source MAC address to 2.2.2; use the system time as time source for time-stamp:

```
TAP# configure terminal
TAP(config)# timestamp-over-ether 1.1.1 2.2.2 0xff12
TAP(config)# timestamp sync systime
```

The following example shows how to create 3 TAP groups, with 3 source ports eth-0-1/eth-0-2/eth-0-3, and with 3 destination ports eth-0-10/eth-0-20/eth-0-30 which enabled time stamp:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1
TAP(config-tap-tap1)# egress eth-0-10 timestamp
TAP(config-tap-tap1)# exit
TAP(config)# tap-group tap2
TAP(config-tap-tap2)# ingress eth-0-2
```

```
TAP(config-tap-tap2)# egress eth-0-20 timestamp
TAP(config-tap-tap2)# exit
TAP(config)# tap-group tap3
TAP(config-tap-tap3)# ingress eth-0-3
TAP(config-tap-tap3)# egress eth-0-30 timestamp
TAP(config-tap-tap3)# exit
```

19.5 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID:
  Ingress:
    eth-0-1
  egress:
    eth-0-10      time-stamp
TAP-group tap2
ID: 2
  Ingress:
    eth-0-2
  egress:
    eth-0-20      time-stamp
TAP-group tap3
ID: 3
  Ingress:
    eth-0-3
  egress:
    eth-0-30      time-stamp
```

19.6 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
timestamp-over-ether 0001.0001.0001 0002.0002.0002 0xff12
!
timestamp sync systime
!
tap-group tap1 1
  ingress eth-0-1
egress eth-0-10 timestamp
!
tap-group tap2 2
  ingress eth-0-2
egress eth-0-20 timestamp
!
tap-group tap3 3
  ingress eth-0-3
egress eth-0-30 timestamp
```

20

Packet truncation Configuration

20.1 Overview

PACKET TRUNCATION

Figure 20-1 sketch map of packet truncation

20.2 Configuration Ideas

In some cases, packets need to be truncated in order to reduce the pressure of the server or in order to protect privacy. The packet truncation application can meet the requirement. E.g. The size of the packet enters the TAP device from eth-0-1 is 1518 bytes. The size of the packet leaves destination port eth-0-10 is 64 byte.

20.3 Configuration

PORT mode and PORT WITH FLOW mode both support packet truncation.

20.3.1 Packet Truncation for PORT mode

The following example shows how to set the packet length after truncated to 64 byte:

```
TAP# configure terminal
TAP(config)# truncation 64
```

The follow example shows how to create TAP group with ingress port eth-0-1 and enable packet truncation:

```
TAP# configure terminal
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 truncation
TAP(config-tap-tap1)# egress eth-0-10
```

20.3.2 Packet Truncation for PORT WITH FLOW mode

The following example shows how to set a flow rule to match the packets with destination IP address 1.1.1.0/24 and enable truncation. Packets with other destination IP address should not be truncated:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip any dst-ip 1.1.2.0 0.0.0.255
truncation
TAP(config-flow-flow1)# permit any src-ip any dst-ip any
TAP(config-flow-flow1)# exit
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

20.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          truncation
  egress:
    eth-0-10
```

NOTE

The result above shows the TAP group for PORT mode.

20.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
truncation 64
!
tap-group tap1 1
  ingress eth-0-1 truncation
  egress eth-0-10
```

NOTE

Packet truncation is mutually exclusive to other actions. E.g. Only Packet truncation is effective and all other configuration(egress-filter/time stamp etc.) is invalid in the following configuration:

```
ip access-list filter1
sequence-num 10 deny any src-ip any dst-ip any
!
interface eth-0-2
```

```
egress filter1
!
timestamp-over-ether 000A.000A.000A 000B.000B.000B 0xff12
!
tap-group tap1
  ingress eth-0-1 truncation
  egress eth-0-2 timestamp
```

21

Packet header stripping

Configuration

21.1 Configuring strip the VXLAN header

21.1.1 Networking requirements

Figure 21-1 Topology of stripping VXLAN header

21.1.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with VXLAN/NVGRE/GRE header. The packet header stripping application can resolve the problem.

Reference to the Figure the packet enter eth-0-1, the VLAN header should be stripped

21.1.3 Configuration

The following example shows how to create a flow rule the match the VXLAN packets and strip the header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit udp dst-port eq 4789 vxlan-vni any src-ip any
```

```
dst-ip any strip-header
TAP(config-flow-flow1) # exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config) # tap-group tap1
TAP(config-tap-tap1) # ingress eth-0-1 flow flow1
TAP(config-tap-tap1) # egress eth-0-10
TAP(config-tap-tap1) # end
```

21.1.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

21.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
  sequence-num 10 permit udp dst-port eq 4789 vxlan-vni any src-ip any dst-ip any
  strip-header
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10

TAP(config) # flow flow1
TAP(config-flow-map1) # permit udp dst-port eq 4789 vxlan-vni 1000 0x0 src-ip any
dst-ip any strip-header
TAP(config-tap-tap1) # end
```

NOTE

TAP series devices support to match the specified VNI. E.g. match VNI 1000 and strip the VXLAN header. you can configure flow udp dst-port not 4789 to match vxlan, but now you just can configure the same global vxlan dst-port .

```
TAP(config) # flow flow1
TAP(config-flow-map1) # permit udp dst-port eq 1234 vxlan-vni 1000 0x0 src-ip any
dst-ip any strip-header
TAP(config-flow-map1) # permit udp dst-port eq 1234 vxlan-vni 1200 0x0 src-ip any
dst-ip any strip-header
TAP(config-tap-tap1) # end
```

21.2 Configuring strip the NVGRE header

21.2.1 Networking requirements

Figure 21-1 Topology of stripping NVGRE header

21.2.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with VXLAN/NVGRE/GRE header. The packet header stripping application can resolve the problem.

Reference to the Figure the packet enter eth-0-1, the NVGRE header should be stripped

21.2.3 Configuration

The following example shows how to create a flow rule the match the NVGRE packets and strip the header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit nvgre src-ip any dst-ip any strip-header
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

21.2.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

21.2.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit nvgre src-ip any dst-ip any strip-header
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

21.3 Configuring strip the GRE header

21.3.1 Networking requirements

Figure 21-1 Topology of stripping GRE header

21.3.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with VXLAN/NVGRE/GRE header. The packet stripping application for GRE packet should strip the outer IP address, MAC address and GRE header, only inner IP address and payload are left. Packet editing applications should be configured together with packet header stripping, in order to add an outer MAC address.

Reference to the Figure the packet enters eth-0-1, the GRE header should be stripped and a new MAC address should be added.

21.3.3 Configuration

The following example shows how to create a flow rule the match the GRE packets and strip the header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit gre src-ip any dst-ip any strip-header edit-macsa
a.a.a edit-macda b.b.b
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

21.3.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

NOTE

GRE header length is flexible. In the example above, the flow only matches the GRE field, and only strips the standard GRE header which is 4 bytes. If the packets need to strip header include GRE-key, the configuration is as follows(Match GRE and GRE-KEY field). It means that, if the flow only matches the GRE field, the stripped length is 4 bytes; if the flow matches the GRE and GRE-KEY field, the stripped length is 8 bytes. If the packet with a GRE header which is more than 8

byte, or with variable types of GRE packets(For example, the packets with 4/8/12/16 bytes GRE header exist at same time), please reference to the chapter “Configuring strip the User Defined header”.

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit gre gre-key any src-ip any dst-ip any
strip-header edit-macsa a.a.a edit-macda b.b.b
TAP(config-flow-flow1)# exit
```

21.3.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit gre src-ip any dst-ip any strip-header edit-macda
000B.000B.000B edit-macsa 000A.000A.000A
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

21.4 Configuring strip the IPIP header

21.4.1 Networking requirements

Figure 21-1 Topology of stripping IPIP header

21.4.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with an IPIP header. The packet stripping application for IPIP packet should strip the outer IP address, MAC header,

only inner IP address and payload are left. Packet editing applications should be configured together with packet header stripping, in order to add an outer MAC address.

Reference to the Figure the packet enters eth-0-1, the IPIP header should be stripped and a new MAC address should be added.

21.4.3 Configuration

The following example shows how to create a flow rule the match the IPIP packets and strip the header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit ipip src-ip any dst-ip any strip-header
edit-macsa a.a.a edit-macda b.b.b
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

21.4.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

21.4.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit ipip src-ip any dst-ip any strip-header edit-macda
000B.000B.000B edit-macsa 000A.000A.000A
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

21.5 Configuring strip the User Defined header

21.5.1 Networking requirements

Figure 21-1 Packet structure

21.5.2 Configuration Ideas

Normal packet header stripping applications can strip the standard VXLAN/GRE/NVGRE header, which cannot match all cases. e.g. GRE header may have variable length because GRE-KEY/Checksum/Sequence Num inserted. By default, packet header stripping can strip GRE header and one option field of 4 bytes. When the GRE packet has more than one option field, the packet header stripping cannot strip them correctly.

The user defined header stripping application can resolve the problem. A starting position (L2, L3 or L4) and offset (up to 30 bytes) should be specified before using user defined header stripping.

The following example shows how to strip the GRE packets with GRE-KEY/Checksum/Sequence Number

21.5.3 Configuration

Create a flow rule to match GRE packets and enable user defined stripping:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit gre src-ip any dst-ip any strip-header
strip-position l4 strip-offset 16 edit-macsa a.a.a edit-macda b.b.b
TAP(config-flow-flow1)# exit
```

NOTE

Strip-position is L4 and offset is 16 means remove 16 bytes after L4 header and remove all fields before L4 header.

Create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

21.5.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

21.5.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit gre src-ip any dst-ip any strip-header strip-position 14
strip-offset 16 edit-macda 000B.000B.000B edit-macsa 000A.000A.000A
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

21.6 Configuring strip the ERSPAN header

21.6.1 Networking requirements

Figure 21-1 Packet structure

21.6.2 Configuration Ideas

In some cases, users need to match the packets with ERSPAN ID among those packets with GRE+ERSPAN+VXLAN header, and need to strip the ERSPAN header. VXLAN header may also need to be stripped. Matching ERSPAN ID can meet the requirement.

21.6.3 Configuration

The following example shows how to create a flow rule to match the ERSPAN packets with span id 1, and strip the GRE+ERSPAN header and add vlan 1:

```
TAP(config)# flow erspan
TAP(config-flow- erspan)# permit gre erspan 1 0x0 src-ip any dst-ip any
strip-header add-vlan 1
```

The following example shows how to create a flow rule to match the ERSPAN packets with span id 2, and strip the GRE+ERSPAN+vxlan header and add vlan 3:

```
TAP(config)# flow erspan
TAP(config-flow-erspan)# permit gre erspan 2 0x0 src-ip any dst-ip any
strip-header strip-inner-vxlan-header add-vlan 3
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow erspan:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow erspan
TAP(config-tap-tap1)# egress eth-0-10
```

21.6.4 Validation

The following example shows how to display the information of the flow rule:

```
TAP# show flow
flow erspan
sequence-num 10 permit gre erspan 1 0x0 src-ip any dst-ip any strip-header edit
-vlan 1
sequence-num 20 permit gre erspan 2 0x0 src-ip any dst-ip any strip-header edit
-vlan 3
```

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
Ingress:
    eth-0-1          flow erspan
egress:
    eth-0-10
```

21.6.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow erspan
sequence-num 10 permit gre erspan 1 0x0 src-ip any dst-ip any strip-header add
-vlan 1
sequence-num 20 permit gre erspan 2 0x0 src-ip any dst-ip any strip-header edit
-vlan 3
!
tap-group tap1 1
ingress eth-0-1 flow erspan
egress eth-0-10
```

21.7 Configuring strip the MPLS header

21.7.1 Networking requirements

Figure 21-1 Topology of stripping MPLS header

21.7.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with MPLS LABEL header. The packet header stripping application can resolve the problem. TAP supports matching the number of mpls labels(up to 9) and the value of mpls labels(upp to 3). If the stripped message is a IPv4 message, the operation of adding a mac-header is supported.

Reference to the Figure the packet enter eth-0-1, the MPLS header should be stripped

21.7.3 Configuration

The following example shows how to create a flow rule the match the MPLS packets and strip the header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit mpls label-num 2 mpls-label1 any mpls-label2 100
strip-header
TAP(config-flow-flow1)# exit
```

The following example shows how to create a flow rule the match the MPLS packets, strip the header and add mac-header:

```
TAP(config)# flow flow2
TAP(config-flow-flow1)# permit mpls label-num 3 mpls-label1 any mpls-label2 100
mpls-label3 200 strip-header add-l2macda 1.1.1 add-l2macsa 2.2.2
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# exit

TAP(config)# tap-group tap2
TAP(config-tap-tap1)# ingress eth-0-1 flow flow2
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

21.7.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
TAP-group tap2
ID: 2
  Ingress:
    eth-0-1          flow flow2
  Egress:
    eth-0-10
```

21.7.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit mpls label-num 2 mpls-label2 100 strip-header
exit
!
flow flow2
sequence-num 10 permit mpls label-num 3 mpls-label2 100 mpls-label3 100
strip-header add-l2macda 0001.0001.0001 add-l2macsa 0002.0002.0002
exit
!
tap-group tap1 1
ingress eth-0-1 flow flow1
egress eth-0-10
!
tap-group tap2 2
ingress eth-0-1 flow flow2
egress eth-0-10
```

21.8 Configuring strip the PPPOE header

21.8.1 Networking requirements

Figure 21-1 Topology of stripping PPPOE header

21.8.2 Configuration Ideas

In some cases, the server or analyzer cannot parse the packet with PPPOE LABEL header. The packet header stripping application can resolve the problem. TAP supports to match point-to-point protocol type of ipv4 or ipv6. Mac-header needs to be added after stripping.

Reference to the Figure the packet enters eth-0-1, the PPPOE header should be stripped and a new MAC address should be added.

21.8.3 Configuration

The following example shows how to create a flow rule the match the PPPOE packets:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit pppoe ppp-type ipv6
TAP(config-flow-flow1)# exit
```

The following example shows how to create a flow rule the match the PPPOE packets and strip the header:

```
TAP(config)# flow flow2
TAP(config-flow-flow1)# permit pppoe ppp-type ipv4 strip-header add-l2macda
```

```
1.1.1 add-l2macsa 2.2.2 add-l2vlan 10
TAP(config-flow-flow1) # exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config) # tap-group tap1
TAP(config-tap-tap1) # ingress eth-0-1 flow flow1
TAP(config-tap-tap1) # egress eth-0-10
TAP(config-tap-tap1) # exit
TAP(config) # tap-group tap2
TAP(config-tap-tap1) # ingress eth-0-1 flow flow2
TAP(config-tap-tap1) # egress eth-0-10
TAP(config-tap-tap1) # end
```

21.8.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
TAP-group tap2
ID: 2
  Ingress:
    eth-0-1          flow flow2
  egress:
    eth-0-10
```

21.8.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
  sequence-num 10 permit pppoe ppp-type ipv6
  exit
!
flow flow2
  sequence-num 10 permit pppoe ppp-type ipv4 strip-header add-l2macda
  0001.0001.0001 add-l2macsa 0002.0002.0002 add-l2vlan 10
  exit
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
!
tap-group tap2 2
  ingress eth-0-1 flow flow2
  egress eth-0-10
```

22

AAA Configuration

AAA(Authentication/Authorization/Accounting)is a security mechanism for network management, which supports 3 applications: Authentication, Authorization and Accounting. The TAP series devices support to certify the users access the network.

22.1 Configuring Radius Authentication

22.1.1 Networking requirements

Figure 22-1 Topology of Radius Authentication

22.1.2 Configuration Ideas

Radius is a distributed server/client system to prevent unauthorized access and to guarantee the security of the network.

Radius server keeps all information of users' authentication and network service accessing. Radius server should do Authentication/Authorization/Accounting according to the user information in the local database, after it receives a request from a client.

22.1.3 Configuration

The following example shows how to enable AAA and set the mode of Authentication/Authorization/Accounting:

```

TAP(config)# aaa new-model
TAP(config)# aaa authentication login radius-authen radius
TAP(config)# aaa authorization exec radius-author radius
TAP(config)# aaa accounting exec radius-acct start-stop radius
  
```

The following example shows how to set the parameter of the radius server:

```
TAP(config)# radius-server host mgmt-if 10.10.1.1 key test auth-port 1819
```

The following example shows how to set the login mode to radius:

```
TAP(config)# line vty 0 7
TAP(config-line)# login authentication radius-authen
TAP(config-line)# privilege level 4
TAP(config-line)# no line-password
```

22.1.4 Validation

Use the username and password on radius server to login the device.

22.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
aaa new-model
!
aaa authentication login radius-authen radius
!
aaa authorization exec radius-author radius
!
aaa accounting exec radius-acct start-stop radius
!
line vty 0 7
  exec-timeout 35791 0
  privilege level 4
  no line-password
  login authentication radius-authen
```

23

Sflow Configuration

Sflow (Sampled Flow) is a traffic monitoring technology based on packet sampling.

Sflow is used to analyze the network traffic.

Sflow has 2 types of message: statistics information for ports and sampled packets information.

23.1.1 Networking requirements

Figure 23-1 Topology of Sflow

23.1.2 Configuration Ideas

Traffic monitoring is a basic requirement of network management.

Users need to find the source of abnormal traffic and attacking traffic in time. Sflow, which is a traffic monitoring technology based on packet sampling can meet the requirement.

23.1.3 Configuration

The following example shows how to enable sflow and set the sampling interval, IP address of the agent and IP address of the collector:

```
TAP(config)# sflow enable
TAP(config)# sflow counter interval 20
TAP(config)# sflow agent ip 3.3.3.1
TAP(config)# sflow collector mgmt-if 3.3.3.2
```

The follow example shows how to enable sflow on a port and set the sampling rate:

```
TAP(config)# interface eth-0-1
TAP(config-if-eth-0-1)# sflow flow-sampling rate 32768
TAP(config-if-eth-0-1)# sflow flow-sampling enable input
TAP(config-if-eth-0-1)# sflow counter-sampling enable
```

23.1.4 Validation

The following example shows how to display the information of sflow:

```
TAP# show sflow
sFlow Version: 4
sFlow Global Information:
  Agent IPv4 address      : 3.3.3.1
  Counter Sampling Interval : 20 seconds
  Collector 1:
    IPv4 Address: 3.3.3.2
    Port: 6343

sFlow Port Information:
```

Port	Counter	Flow	Flow-Sample Direction	Flow-Sample Rate
XGe0-1	enable	enable	Input	32768

23.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
sflow enable
sflow agent ip 3.3.3.1
sflow counter interval 20
!
sflow collector mgmt-if 3.3.3.2
!
interface eth-0-1
  speed 1000
  duplex full
  sflow counter-sampling enable
  sflow flow-sampling enable input
!
```

24

RPC API Configuration

RPC API service allows users to configure and monitor the switch system through Remote Procedure Calls (RPC) from your program.

RPC API service uses JSON over HTTP protocol to communicate the switch from your program. Users may issue switch CLI commands through RPC method. By default, the CLI mode is in EXEC mode.

Users could send RPC requests via an HTTP POST request to the URL: `http://switch_management_ip_address:switch_tcp_port_number/api/cmd_api/`.

The detailed RPC request and response are shown below by JSON format.

RPC server and HTTP server listen to the same port by default. The HTTP server should be disabled first when we use the same port.

24.1.1 Configuration

24.1.2 RPC API Service configuration

RPC API service via http(tcp port 80) is disabled by default. The following example shows how to enable it:

```
TAP# configure terminal
TAP(config)# service rpc-api enable
TAP(config)# exit
```

RPC API service via https(tcp port 443) is enabled by default. The following example shows how to enable it:

```
Switch# configure terminal
Switch(config)# service rpc-api enable ssl
Switch(config)# exit
```

The following example shows how to disable RPC API:

```
Switch# configure terminal
Switch(config)# service rpc-api disable
Switch(config)# exit
```

24.2 JSON-RPC Request

24.2.1 Request

```
{
  "params":
  {
    "format":"json",
    "version":1,
    "cmds":["show services"]
  }
}
```

24.2.2 Response

```

err_code: 0
err_reason:
```

24.2.3 RPC Error Code

Error code	Description
RPC_ERROR_CLI_TIMEOUT = -1000	RPC TIMEOUT, Don't load too much CLI to the system in one message.
RPC_ERROR_CLI_FAIL = -1001	CLI Fail, User should Note the source Details information for detail

RPC_ERROR_CLI_AUTH_FAIL = -1002	Username or password error
RPC_ERROR_CLI_AUTH_LOW = -1003	User privilege is too low
RPC_ERROR_CLI_NOT_SUPPORT = -1004	Unsupported CLI by RPC
RPC_ERROR_CHAR_NOT_SUPPORT = -1005	RPC message format or version can't be supported.
RPC_ERROR_STRING_NOT_SUPPORT = -1006	Unsupported string by RPC, e.g. "service rpc-api disable", "ssh", "telnet", "source", "ovs-ofctl snoop", "start sh", "reboot", "reload", "format"
RPC_ERROR_MESSAGE_NOT_SUPPORT = -1007	RPC packet format error or version error

24.2.4 Validation

The following example shows how to display the information of system service:

```
DUT1# show services
Networking services configuration:
Service Name Status Port Protocol
-----+-----+-----+-----
dhcp          disable    67/68    UDP
http           disable     80      TCP
https          disable    443      TCP
rpc-api        enable     80      TCP
telnet         enable     23      TCP
ssh            enable     22      TCP
snmp           disable    161     UDP
```

The following example shows how to display the information of rpc-api service:

```
TAP # show services rpc-api
RPC-API service configuration:
Server State      : enable
Port              : 80
Authentication Mode : none
SSL State         : disable
Message Execute   : 0
Message Deny     : 0
```

24.2.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
service rpc-api enable
!
```

25

Packet header add Configuration

25.1 Configuring add the L2-GRE header

25.1.1 Networking requirements

Figure 25-1 Topology of add L2-GRE header

25.1.2 Configuration Ideas

In some cases, server site don not in local places,so traffic with remote sites via L2-GRE. And hold original frame, client need that device have function adding L2-gre packet Header

25.1.3 Configuration

The following example shows how to create a flow rule the match the packets and add L2-GRE header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip any dst-ip 1.1.0.1 0.0.0.0 add-l2gre
l2gre-sip 10.0.0.1 l2gre-dip 10.2.1.1 l2gre-dmac a.a.a l2gre-key 1
l2gre-key-length 24
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
```

```
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

NOTE

The gre-key-length can config 16,20,24,32 about add-L2-GRE . gre-key-length 16 have gre-key range 1-65535,gre-key-length 20 have gre-key range 1-1048575,gre-key-length 24 have gre-key range 1-16777215,gre-key-length 32 have gre-key range 1-4294967295.

25.1.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

25.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit any src-ip any dst-ip host 1.1.0.1 add-l2gre l2gre-sip
10.0.0.1 l2gre-dip 10.2.1.1 l2gre-dmac 000a.000a.000a l2gre-key 1
l2gre-key-length 24!
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

25.2 Configuring add the L3-GRE header

25.2.1 Networking requirements

Figure 25-1 Topology of add L3-GRE header

25.2.2 Configuration Ideas

In some cases, server site don not in local place,so traffic with remote sites via L3-GRE.client need that device have function adding L3-gre packet Header

25.2.3 Configuration

The following example shows how to create a flow rule the match the packets and add L3-GRE header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip host 1.1.0.2 dst-ip any add-l3gre
l3gre-sip 3.3.3.3 l3gre-dip 4.4.4.3 l3gre-dmac b.b.b
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

25.2.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group
```

```
TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

25.2.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10permit any src-ip host 1.1.0.2 dst-ip any add-l3gre l3gre-sip
3.3.3.3 l3gre-dip 4.4.4.3 l3gre-dmac b.b.b
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

25.3 Configuring add the VXLAN header

25.3.1 Networking requirements

Figure 25-1 Topology of add VXLAN header

25.3.2 Configuration Ideas

In some cases, server site does not in local place,so traffic with remote sites via VXLAN.client need that device have function adding VXLAN packet Header

25.3.3 Configuration

The following example shows how to create a flow rule the match the packets and add VXLAN header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip host 1.1.0.2 dst-ip any add-vxlan
vxlan-sip 1.1.1.1 vxlan-dip 2.2.2.2 vxlan-dmac a.a.a vxlan-set-vni 100
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

25.3.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

25.3.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit any src-ip host 1.1.0.2 dst-ip any add-vxlan vxlan-sip
1.1.1.1 vxlan-dip 2.2.2.2 vxlan-dmac a.a.a vxlan-set-vni 100
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

25.4 Configuring add the ERSPAN header

25.4.1 Networking requirements

Figure 25-1 Topology of add erspan header

25.4.2 Configuration Ideas

In some cases, the server site is not in a local place, so traffic with remote sites via erspan.client need that device to have function adding an erspan packet Header. There are two types of erspan, type1 and type2.

25.4.3 Configuration

The following example shows how to create a flow rule the match the packets and add erspan type1 header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip host 1.1.0.2 dst-ip any add-erspan
erspan-type1 erspan-sip 1.1.1.1 erspan-dip 2.2.2.2 erspan-dmac a.a.a
TAP(config-flow-flow1)# exit
```

The following example shows how to create a flow rule the match the packets and add erspan type2 header:

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit any src-ip host 1.1.0.3 dst-ip any add-erspan
erspan-type2 erspan-sip 1.1.1.1 erspan-dip 2.2.2.2 erspan-dmac a.a.a
erspan-spanid 100
TAP(config-flow-flow1)# exit
```

The following example shows how to create a TAP group with ingress port eth-0-1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress eth-0-1 flow flow1
```

```
TAP(config-tap-tap1)# egress eth-0-10
TAP(config-tap-tap1)# end
```

25.4.4 Validation

The following example shows how to display the information of the TAP group:

```
TAP# show tap-group

TAP-group tap1
ID: 1
  Ingress:
    eth-0-1          flow flow1
  egress:
    eth-0-10
```

25.4.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
sequence-num 10 permit any src-ip host 1.1.0.2 dst-ip any add-erspan
erspan-type1 erspan-sip 1.1.1.1 erspan-dip 2.2.2.2 erspan-dmac a.a.a
sequence-num 20 permit any src-ip host 1.1.0.3 dst-ip any add-erspan
erspan-type2 erspan-sip 1.1.1.1 erspan-dip 2.2.2.2 erspan-dmac 000a.000a.000a
erspan-spanid 100
!
tap-group tap1 1
  ingress eth-0-1 flow flow1
  egress eth-0-10
```

26

Port-group Configuration

26.1 Configuring add the port-group

26.1.1 Networking requirements

Figure 26-1 Topology of Port-group

26.1.2 Configuration Ideas

In some cases, multiple ports join in a port-group to use an ACL flow resource together.

26.1.3 Configuration

The following example shows how to create a flow rule the match the packets :

```
TAP(config)# flow flow1
TAP(config-flow-flow1)# permit mpls any
```

```
TAP(config-flow-flow1)# permit gre src-ip any dst-ip any
TAP(config-flow-flow1)# exit
```

The following example shows how to create a port-group and add member interfaces :

```
TAP(config)# port-group portgroup1
TAP(config-port-portgroup1)# member interface eth-0-1
TAP(config-port-portgroup1)# member interface eth-0-2
TAP(config-port-portgroup1)# exit
```

The following example shows how to create a TAP group with ingress portgroup1 and flow1:

```
TAP(config)# tap-group tap1
TAP(config-tap-tap1)# ingress portgroup1 flow flow1
TAP(config-tap-tap1)# egress eth-0-9
TAP(config-tap-tap1)# end
```

The following example shows how to show port-group flow statistics:

```
TAP# show port-group flow statistics portgroup1
TAP group name: tap1
  flow name: flow1
    sequence-num 10 permit mpls any ( bytes 0 packets 0 )
    sequence-num 20 permit gre src-ip any dst-ip any ( bytes 0 packets 0 )
(total bytes 0 total packets 0 )
```

26.1.4 Validation

The following example shows how to display the information of the flow:

```
TAP# show flow
flow flow1
  sequence-num 10 permit mpls any
  sequence-num 20 permit gre src-ip any dst-ip any
```

The following example shows how to display the information of the port-group:

```
TAP# show port-group
port-group portgroup1 1
  member interface eth-0-1
  member interface eth-0-2
```

The following example shows how to display the information of the tap-group:

```
TAP# show tap-group
truncation      : 144
timestamp-over-ether : 0000.0000.0000 0000.0000.0000 0x0000

TAP-group tap1
ID: 1
Ingress:
  portgroup1      flow flow1
Egress:
  eth-0-9
```

26.1.5 Configuration file

User can display the configuration files as below:

```
TAP# show running-config
!
flow flow1
  sequence-num 10 permit mpls any
  sequence-num 20 permit gre src-ip any dst-ip any
exit
!
tap-group tap1 1
  ingress portgroup1 flow flow1
  egress eth-0-9
!
port-group portgroup1 1
  member interface eth-0-1
  member interface eth-0-2
!
```

27

Configuring IPFIX

27.1 Overview

27.1.1 Function Introduction

Traffic on a data network can be seen as consisting of flows passing through network elements. For administrative or other purposes, it is often interesting, useful, or even necessary to have access to information about these flows that pass through the network elements. This requires uniformity in the method of representing the flow information and the means of communicating the flows from the network elements to the collection point. This is what IPFIX can do.

Before IPFIX was introduced, there was a Cisco private method NetFlow. IPFIX is similar to NetFlow and is based on NetFlow version 9.

27.1.2 Principle Description

N/A

27.2 Configuration

1 step 1 Enter the configure mode

```
Switch# configure terminal
```

2 step 2 Set the aging time(optional)

Set the aging time as 300 seconds. The aging time is 1800 seconds by default.

```
Switch(config)# ipfix global  
Switch(Config-ipfix-global)# flow aging 300  
Switch(Config-ipfix-global)# exit
```

3 step 3 Configuring recorder

```
Switch(config)# ipfix recorder recorder1  
Switch(Config-ipfix-reocrder)# match mac source address  
Switch(Config-ipfix-reocrder)# match ipv4 source address mask 32
```

```
Switch(Config-ipfix-reocrder)# match ipv4 destination address mask 32
Switch(Config-ipfix-reocrder)# match vxlan-vni
Switch(Config-ipfix-reocrder)# collect counter bytes
Switch(Config-ipfix-reocrder)# collect counter packets
Switch(Config-ipfix-reocrder)# exit
```

4 step 4 Configuring sampler

```
Switch(config)# ipfix sampler sampler1
Switch(Config-ipfix-sampler)# 1 out-of 100
Switch(Config-ipfix-sampler)# exit
```

5 step 5 Configuring exporter

```
Switch(config)# ipfix exporter exporter1
Switch(Config-ipfix-exporter)# destination mgm-if ipv4 9.0.0.1
Switch(Config-ipfix-exporter)# flow data timeout 200
Switch(Config-ipfix-exporter)# event flow end timeout
Switch(Config-ipfix-exporter)# flow data flush threshold count 20
Switch(Config-ipfix-exporter)# exit
```

6 step 6 Configuring monitor

```
Switch(config)# ipfix monitor monitor1
Switch(Config-ipfix-monitor)# recorder recorder1
Switch(Config-ipfix-monitor)# exporter exporter1
Switch(Config-ipfix-monitor)# exit
```

7 step 7 Enter the interface configure mode and apply ipfix

```
Switch(config)# interface eth-0-1
Switch(config-if)# ipfix monitor input monitor1 sampler sampler1
Switch(config-if)# no shutdown
Switch(config-if)# exit
```

8 step 8 Exit the configure mode

```
Switch(config)# end
```

9 step 9 Send 100 ip packets to eth-0-1

10 step 10 Validation

Use the following commands to validate the configuration:

```
Switch# show ipfix global
IPFIX global information:
  Current flow cache number           : 1(ingress: 1, egress: 0)
  Flow cache aging interval           : 300 seconds
  Flow cache export interval          : 5 seconds
  Flow cache sampler mode              : all

Switch# show ipfix recorder recorder1
IPFIX recorder information:
  Name                                : recorder1
```

```

Description      :
Match info      :
    match Source Mac Address
    match IPv4 Source Address
    match IPv4 Destination Address
    match Vxlanvni
Collect info     :
    collect Flow Byte Number
    collect Flow Packet Number

Switch# show ipfix exporter exporter1
IPFIX exporter information:
    Name                      : exporter1
    Description                :
    Domain ID                  : 0
    Collector Name             : 9.0.0.1
    IPFIX message protocol     : UDP
    IPFIX message destination Port : 2055
    IPFIX message TTL value    : 255
    IPFIX message DSCP value   : 63
    IPFIX data interval       : 200
    IPFIX template interval    : 1800
    IPFIX exporter events     :
        Flow aging event

Switch# show ipfix sampler sampler1
IPFIX sampler information:
    Name                      : sampler1
    Description                :
    Rate                      : 100

Switch# show ipfix monitor monitor1
IPFIX monitor information:
    Name                      : monitor1
    Description                :
    Recorder                  : recorder1
    exporter                  : exporter1

Switch# show ipfix cache observe-point interface eth-0-1 input
Cache dir          : input
Cache flow profile : 0
Cache key profile  : 0
Cache key info    :
    Source mac      : 0000.0002.0001
    ipsa            : 10.10.10.3/32
    ipda            : 10.10.10.1/32
Cache collect info:
    Byte number of ingress : 64
    Packet number of ingress : 1

```

27.3 Application cases

N/A

28

Tips

- To full fill the keyword of any command line in any command mode, use TAB on the keyboard. It is unnecessary to type every letter of the keywords.
- To get the help information of the command line, use the “?” symbol.
- To quit to the up level of the command mode, use “quit” or “exit”. To return to Privileged EXEC mode, use “end”.
- To save the current configuration, use “write memory”. Users should use the “write memory” command on time in order to prevent loss of configuration after device reboot.
- To get more description of the command line, please refer to the CLI guide.
- To get detailed information about the feature, please reference to the User guide.
- The “no” form of the command line is usually used to delete the configuration or restore the default value. E.g.: configuration “speed 1000” should be removed by “no speed”.

For questions, please contact Garland Technology Support at:
8AM-9PM (CST) Monday - Friday (Except for observed US Holidays)
